

Outline

Machine Learning: when Artificial Intelligence meets Big Data

The Learning Models

Machine Learning Methodology

Machine Learning for Data Science

Aurélien Garivier

Formation 2018

Artificial Intelligence (AI): Definition

Intelligence exhibited by machines

- emulate cognitive capabilities of humans (big data: humans learn from abundant and diverse sources of data).
- a machine mimics "cognitive" functions that humans associate with other human minds, such as "learning" and "problem solving".

Ideal "intelligent" machine =

flexible rational agent that perceives its environment and takes actions that maximize its chance of success at some goal.

Founded on the claim that human intelligence

"can be so precisely described that a machine can be made to simulate it."

Artificial Intelligence: Tension

Operational goals

- Autonomous robots for not-too-specialized tasks
- In particular, vision + understand and produce language

Tension between operational and philosophical goals

- As machines become increasingly capable, facilities once thought to require intelligence are removed from the definition. For example, optical character recognition is no longer perceived as an exemplar of "artificial intelligence"; having become a routine technology.
- Capabilities still classified as AI include advanced Chess and Go systems and self-driving cars.

Machine Learning (ML): Definition

Arthur Samuel (1959)

Field of study that gives computers the ability to learn without being explicitly programmed

Tom M. Mitchell (1997)

A computer program is said to learn from experience E with respect to some class of tasks T and performance measure P if its performance at tasks in T , as measured by P , improves with experience E .

ML: Learn from and make predictions on **data**

- Algorithms operate by building a model from **example** inputs in order to make data-driven **predictions or decisions**...
- ...rather than following strictly static program instructions: useful when designing and programming explicit algorithms is unfeasible or poorly efficient.

Within Data Analytics

- Machine Learning used to devise complex models and algorithms that lend themselves to **prediction** - in commercial use, this is known as *predictive analytics*.
- www.sas.com: "Produce reliable, repeatable decisions and results" and uncover "hidden insights" through learning from historical **relationships and trends** in the data.
- evolved from the study of pattern recognition and computational learning theory in artificial intelligence.

Machine Learning: Typical Problems

- spam filtering, text classification
- optical character recognition (OCR)
- search engines
- recommendation platforms
- speech recognition software
- computer vision
- bio-informatics, DNA analysis, medicine
- etc.

For each of this task, it is possible but very inefficient to write an explicit program reaching the prescribed goal.

It proves much more succesful to have a machine infer what the good decision rules are.

Related Fields

- **Computational Statistics:** focuses in prediction-making through the use of computers together with statistical models (ex: Bayesian methods).
- **Statistical Learning:** ML by statistical methods, with statistical point of view (probabilistic guarantees: consistency, oracle inequalities, minimax)
→ more focused on *correlation*, less on *causality*
- **Data Mining** (unsupervised learning) focuses more on exploratory data analysis: discovery of (previously) unknown properties in the data. This is the analysis step of Knowledge Discovery in Databases.
- Importance of **probability**- and **statistics**-based methods → **Data Science** (Michael Jordan)
- Strong ties to **Mathematical Optimization**, which delivers methods, theory and application domains to the field

Qu'est-ce qu'une (très grande) masse de données ?

VLDB

Big Data

Very Big Data

Data Deluge

Massive Data

Data Masses

Data inflation

2

Unit	Size	What it means
Bit (b)	1 or 0	Short for "binary digit", after the binary code (1 or 0) computers use to store and process data
Byte (B)	8 bits	Enough information to create an English letter or number in computer code. It is the basic unit of computing
Kilobyte (KB)	1,000, or 2^{10} , bytes	From "thousand" in Greek. One page of typed text is 2KB
Megabyte (MB)	1,000KB; 2^{20} bytes	From "large" in Greek. The complete works of Shakespeare total 5MB. A typical pop song is about 4MB
Gigabyte (GB)	1,000MB; 2^{30} bytes	From "giant" in Greek. A two-hour film can be compressed into 1-2GB
Terabyte (TB)	1,000GB; 2^{40} bytes	From "monster" in Greek. All the catalogued books in America's Library of Congress total 15TB
Petabyte (PB)	1,000TB; 2^{50} bytes	All letters delivered by America's postal service this year will amount to around 5PB. Google processes around 1PB every hour
Exabyte (EB)	1,000PB; 2^{60} bytes	Equivalent to 10 billion copies of <i>The Economist</i>
Zettabyte (ZB)	1,000EB; 2^{70} bytes	The total amount of information in existence this year is forecast to be around 1.2ZB
Yottabyte (YB)	1,000ZB; 2^{80} bytes	Currently too big to imagine

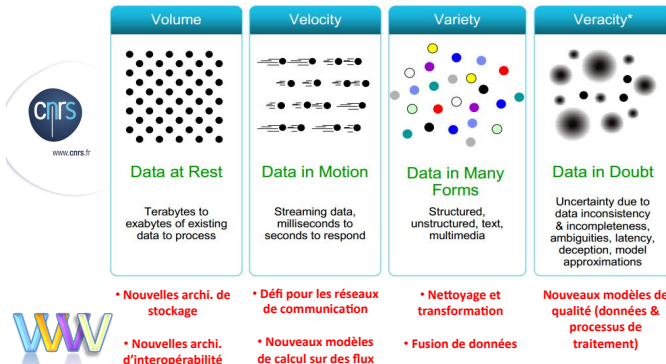

The prefixes are set by an international group, the International Bureau of Weights and Measures. Yotta and Zetta were added in 1991; terms for larger amounts have yet to be established.

Défis accompagnant les chgts

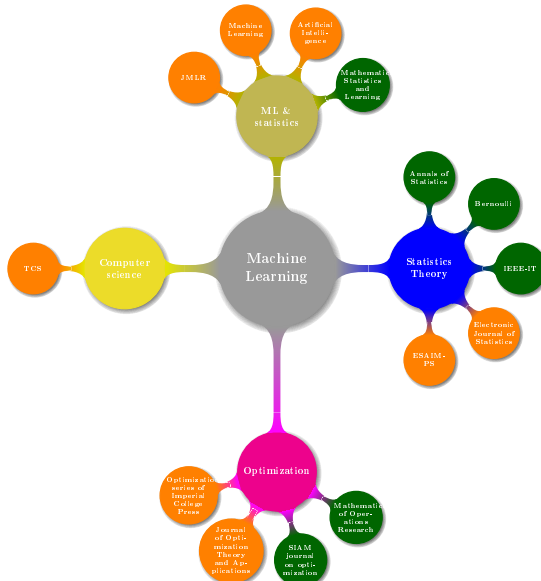

Machine Learning and Statistics

- Data analysis (inference, description) is the goal of statistics for long.
- Machine Learning has more **operational** goals (ex: consistency is important the statistics literature, but often makes little sense in ML).
Models (if any) are *instrumental*
Ex: linear model (nice mathematical theory) vs Random Forests.
- Machine Learning/big data: no separation between statistical modelling and optimization (in contrast to the statistics tradition).
- In ML, data is often here before (unfortunately)
- No clear separation (statistics evolves as well).

ML and its neighbors

ML journals

ML conferences

Outline

Machine Learning: when Artificial Intelligence meets Big Data

The Learning Models

Machine Learning Methodology

What ML is composed of

Unsupervised Learning

- (many) observations on (many) individuals
- need to have a simplified, structured overview of the data
- *taxonomy*: untargeted search for *homogeneous clusters* emerging from the data
- Examples:
 - customer segmentation
 - image analysis (recognizing different zones)
 - exploration of data

Example

Supervised Learning

- observations = pairs (X_i, Y_i)
- goal = learn to *predict* Y_i given X_i
- regression (when Y is continuous)
- classification (when Y is discrete)
- statistical technique: linear models

Example: Character Recognition

Input space \mathcal{X} Output space \mathcal{Y} Joint distribution $P(x, y)$	64×64 images $\{0, 1, \dots, 9\}$?
Prediction function $h \in \mathcal{H}$ Risk $R(h) = P(h(X) \neq Y)$	
Sample $\{(x_i, y_i)\}_{i=1}^n$ Empirical risk $\hat{R}_n(h) = \frac{1}{n} \sum_{i=1}^n \mathbb{1}\{h(x_i) \neq y_i\}$	MNIST dataset
Learning algorithm $\phi_n : (\mathcal{X} \times \mathcal{Y})^n \rightarrow \mathcal{H}$ Expected risk $R_n(\phi) = \mathbb{E}_n[R(\phi_n)]$	NN,boosting...
Empirical risk minimizer $\hat{h}_n = \operatorname{argmin}_{h \in \mathcal{H}} \hat{R}_n(h)$ Regularized empirical risk minimizer $\hat{h}_n = \operatorname{argmin}_{h \in \mathcal{H}} \hat{R}_n(h) + \lambda C(h)$	

Reinforcement Learning

[Src: https://en.wikipedia.org/wiki/Reinforcement_learning]

- area of machine learning inspired by behaviourist psychology
- how software agents ought to take actions in an environment so as to maximize some notion of cumulative reward.
- Model: random system (typically : Markov Decision Process)
 - agent
 - state
 - actions
 - rewards
- sometimes called approximate dynamic programming, or neuro-dynamic programming

Markov decision process

A **Markov Decision Process** is defined as a tuple $M = (X, A, p, r)$:

- X is the **state** space,
- A is the **action** space,
- $p(y|x, a)$ is the **transition probability** with

$$p(y|x, a) = \mathbb{P}(x_{t+1} = y | x_t = x, a_t = a),$$

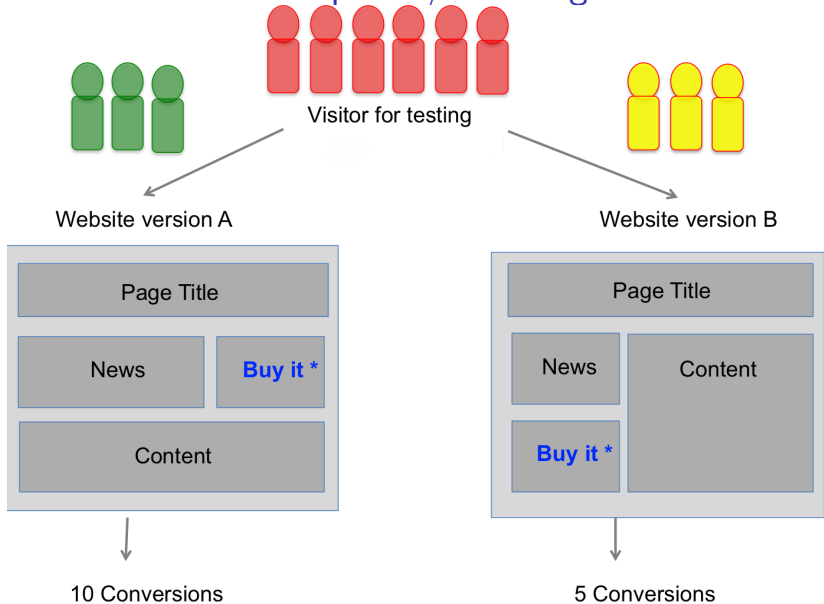

- $r(x, a, y)$ is the **reward** of transition (x, a, y) .

Example: the Retail Store Management Problem

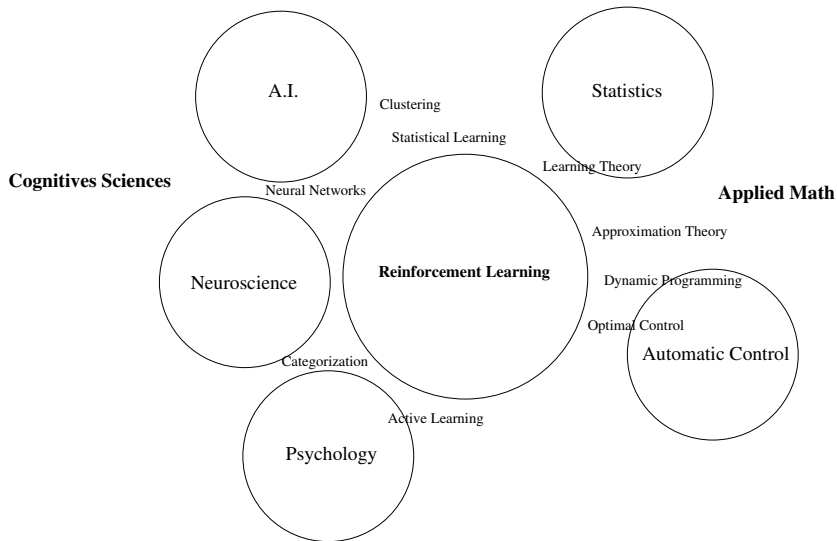

At each month t , a store contains x_t items of a specific goods and the demand for that goods is D_t . At the end of each month the manager of the store can order a_t more items from his supplier. Furthermore we know that:

- The cost of maintaining an inventory of x is $h(x)$.
- The cost to order a items is $C(a)$.
- The income for selling q items is $f(q)$.
- If the demand D is bigger than the available inventory x , customers that cannot be served leave.
- The value of the remaining inventory at the end of the year is $g(x)$.
- **Constraint:** the store has a maximum capacity M .

Example: A/B testing

Reinforcement Learning and the others

Outline of the training program

Day 1 Introducing machine learning. Unsupervised learning:

- Principal component analysis
- Agglomerative Hierarchical Clustering
- k-means, k-medoids and variants
- overview of other methods : Affinity Propagation, dbscan, etc.

Day 2 Supervised learning 1/2:

- k nearest neighbors
- Gaussian linear model, logistic regression, model selection
- LASSO et variants
- Support Vector Machines

Outline of the training program

Day 3 Supervised learning 2 / 2 :

- Decision Trees
- Bagging, Random Forests, Boosting
- Neural networks, deep learning

Day 4 Other learning paradigms:

- Sequential learning, multi-armed bandit problems
- Super-learning and expert aggregation
- Reinforcement learning (introduction)

Outline

Machine Learning: when Artificial Intelligence meets Big Data

The Learning Models

Machine Learning Methodology

ML Data

n -by- p matrix X

- n examples = points of observations
- p features = characteristics measured for each example

Questions to consider:

- Are the features centered?
- Are the features normalized? bounded?

In `scikitlearn`, all methods expect a 2D array of shape (n, p)
often called

X `(n_samples, n_features)`

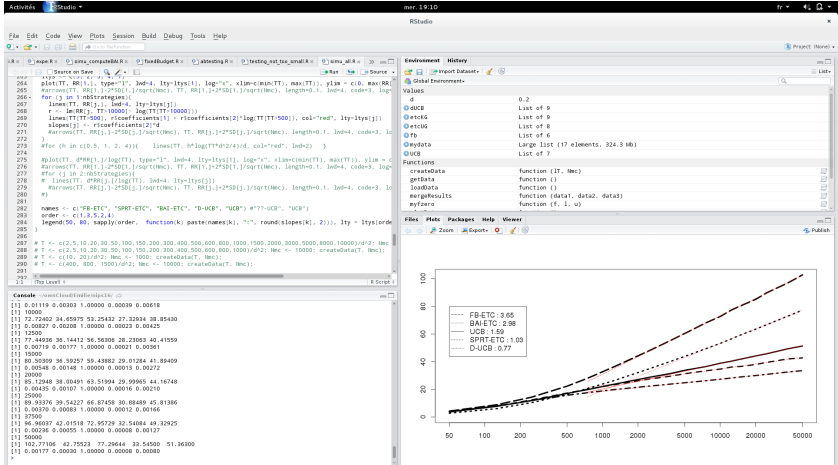

Data repositories

- Inside R: package datasets
- Inside scikitlearn: package sklearn.datasets
- UCI Machine Learning Repository
- Challenges: Kaggle, etc.

The big steps of data analysis

- ① Extracting the data to expected format
- ② Exploring the data
 - detection of outliers, of inconsistencies
 - descriptive exploration of the distributions, of correlations
 - data transformations
- ③ Random partitioning of the data: (see also: cross-validation)
 - learning sample
 - validation sample
 - test sample
- ④ For each algorithm: parameter estimation using training and validation samples
- ⑤ Choice of final algorithm using testing sample, risk estimation

scikitlearn:

http://scikit-learn.org/stable/index.html

The screenshot shows the scikit-learn website homepage. At the top, there's a navigation bar with links for Home, Installation, Documentation, and Examples. A search bar is also present. The main header features the scikit-learn logo and the tagline "Machine Learning in Python". Below this, a grid of 16 small images shows various machine learning visualizations. To the right of the grid, the text "scikit-learn" is displayed in large font, followed by "Machine Learning in Python". Below this, a list of bullet points highlights key features: Simple and efficient tools for data mining and data analysis, Accessible to everybody, and reusable in various contexts, Built on NumPy, SciPy, and matplotlib, and Open source, commercially usable - BSD license. The page is organized into a grid of sections, each with a title, a brief description, applications, algorithms, and examples. The sections include Classification, Regression, Clustering, Dimensionality reduction, Model selection, and Preprocessing. At the bottom, there are three columns: News, Community, and Who uses scikit-learn?, each with a brief description and a link to more information. The AWeber logo is also visible in the bottom right corner.

scikit-learn
Machine Learning in Python

- Simple and efficient tools for data mining and data analysis
- Accessible to everybody, and reusable in various contexts
- Built on NumPy, SciPy, and matplotlib
- Open source, commercially usable - BSD license

Classification
Identifying to which category an object belongs to.
Applications: Spam detection, Image recognition.
Algorithms: SVM, nearest neighbors, random forest, ... — Examples

Regression
Predicting a continuous-valued attribute associated with an object.
Applications: Drug response, Stock prices.
Algorithms: SVR, ridge regression, Lasso, ... — Examples

Clustering
Automatic grouping of similar objects into sets.
Applications: Customer segmentation, Grouping experiment outcomes
Algorithms: k-Means, spectral clustering, mean-shift, ... — Examples

Dimensionality reduction
Reducing the number of random variables to consider.
Applications: Visualization, Increased efficiency
Algorithms: PCA, feature selection, non-negative matrix factorization, ... — Examples

Model selection
Comparing, validating and choosing parameters and models.
Goal: Improved accuracy via parameter tuning
Modules: grid search, cross validation, metrics. — Examples

Preprocessing
Feature extraction and normalization.
Application: Transforming input data such as text for use with machine learning algorithms.
Modules: preprocessing, feature extraction. — Examples

Who uses scikit-learn?
AWeber

Knime, Weka and co: integrated environments

The screenshot displays the Weka Explorer application window. The 'Classify' tab is active, showing the 'J48 - C 0.25 - M 2' classifier. The 'Test options' section is configured with 'Use training set' selected. The 'Classifier output' pane shows the results of a stratified cross-validation:

Stratified cross-validation Summary			
Correctly Classified Instances	144	96	%
Incorrectly Classified Instances	6	4	%
Kappa statistic	0.94		
Mean absolute error	0.035		
Root mean square			

A 'Weka Classifier Tree Visualizer' window is overlaid, showing a decision tree for the 'trees.j48.J4' model. The tree structure is as follows:

```

graph TD
    Root((petalwidth)) -- "<= 0.6" --> L1[Iris-setosa 50.0]
    Root -- "> 0.6" --> R1((petalwidth))
    R1 -- "<= 1.7" --> L2((petalength))
    R1 -- "> 1.7" --> R2[Iris-virginica 46.0/1.0]
    L2 -- "<= 4.9" --> L3[Iris-versicolor 48.0/1.0]
    L2 -- "> 4.9" --> R3((petalwidth))
    R3 -- "<= 1.5" --> L4[Iris-virginica 3.0]
    R3 -- "> 1.5" --> R4[Iris-versicolor 3.0/1.0]
  
```

The background Weka Explorer window also shows a 'Result list' on the left and a 'Visualize' section on the right, which includes a scatter plot of the data points colored by class (Iris-setosa, Iris-versicolor, Iris-virginica).
